

CyberMinions

DevSecOps CI/CD Pipeline with Kubernetes Monitoring

By: Shreya Kumari, Zaid Khan, Saniya Gandhi

1. Abstract

This project demonstrates the implementation of a complete DevSecOps Continuous Integration and Continuous Deployment (CI/CD) pipeline for deploying a containerized web application on Kubernetes. The solution integrates source code management, automated code quality analysis, vulnerability assessment, containerization, image registry management, orchestration, monitoring, and visualization tools.

The project automates the software delivery lifecycle from source code commit to Kubernetes deployment while incorporating security scanning and real-time infrastructure monitoring using Prometheus and Grafana.

2. Project Objective

The primary objectives of this project are:

- Automate application build and deployment.
- Implement DevSecOps practices.
- Perform static code analysis using SonarQube.
- Identify vulnerabilities using Trivy.
- Containerize applications using Docker.
- Store container images in Docker Hub.
- Deploy applications on Kubernetes.
- Enable automated deployment through Jenkins.
- Monitor infrastructure and services using Prometheus and Grafana.

3. Technology Stack

Category	Tool
Version Control	GitHub
CI/CD	Jenkins
Code Quality	SonarQube
Security Scanning	Trivy
Containerization	Docker
Registry	Docker Hub
Orchestration	Kubernetes
Monitoring	Prometheus
Visualization	Grafana
Application	Static Web Application

4. Solution Architecture

5. Infrastructure Setup

Jenkins Server

Responsibilities:

- Pipeline orchestration
- SonarQube integration
- Trivy scanning
- Docker image creation
- Kubernetes deployment
- Installed Components
- Jenkins
- Docker
- Trivy
- Sonar Scanner
- kubectl
- Kubernetes Cluster

Master Node

Responsibilities:

- Cluster management
- Scheduling
- Deployment management

Worker Node

Responsibilities:

- Running application workloads
- Hosting application pods

```
root@k8-master:~# kubectl get nodes
NAME                 STATUS    ROLES    AGE   VERSION
k8-master            Ready    control-plane   9m43s   v1.31.14

root@k8-master:~# kubectl get pods -A
NAMESPACE   NAME                                     READY   STATUS    RESTARTS   AGE
kube-flannel  kube-flannel-ds-hlzh                 1/1     Running   0           7m18s
kube-system   coredns-7c65d6cfc9-5m9md            1/1     Running   0           13m
kube-system   coredns-7c65d6cfc9-bx67r            1/1     Running   0           13m
kube-system   etcd-k8-master                       1/1     Running   0           13m
kube-system   kube-apiserver-k8-master              1/1     Running   0           13m
kube-system   kube-controller-manager-k8-master    1/1     Running   0           13m
kube-system   kube-proxy-s55jq                     1/1     Running   0           13m
kube-system   kube-scheduler-k8-master             1/1     Running   0           13m

root@k8-master:~# kubeadm token list
TOKEN          TTL          EXPIRES          USAGES          DESCRIPTION          EXTRA GROUP

```

6. Application Development

A static web application was developed as the deployment target for the DevSecOps pipeline.

Application components:

- index.html
- style.css
- script.js
- Dockerfile

The application was stored in a GitHub repository and became the source for all CI/CD activities.

7. Source Code Management

GitHub was used as the centralized source control system.

- Activities Performed
- Repository creation
- Source code upload
- Jenkins integration
- Webhook configuration
- Benefits
- Version control
- Collaboration
- Automated build triggering

<https://github.com/zaid404x/CyberMinions>

8. Jenkins Pipeline Implementation

A Declarative Jenkins Pipeline was created to automate the entire software delivery process.

Pipeline Stages

Stage 1: Checkout

Jenkins retrieves the latest source code from GitHub.

Stage 2: SonarQube Analysis

Static code analysis is performed.

Checks include: Code quality, Bugs, Code smells, Maintainability

Stage 3: Trivy Filesystem Scan

The application source files are scanned for vulnerabilities.

Stage 4: Docker Build

Docker image is created.

Example: `docker build -t cyberminions:v1` .

Stage 5: Trivy Image Scan

The built container image is scanned for security vulnerabilities.

Stage 6: Docker Push

Image is pushed to Docker Hub.

Example: `docker push username/cyberminions:v1`

Stage 7: Kubernetes Deployment

Application is deployed using:

`kubectl apply -f deployment.yaml`

`kubectl apply -f service.yaml`

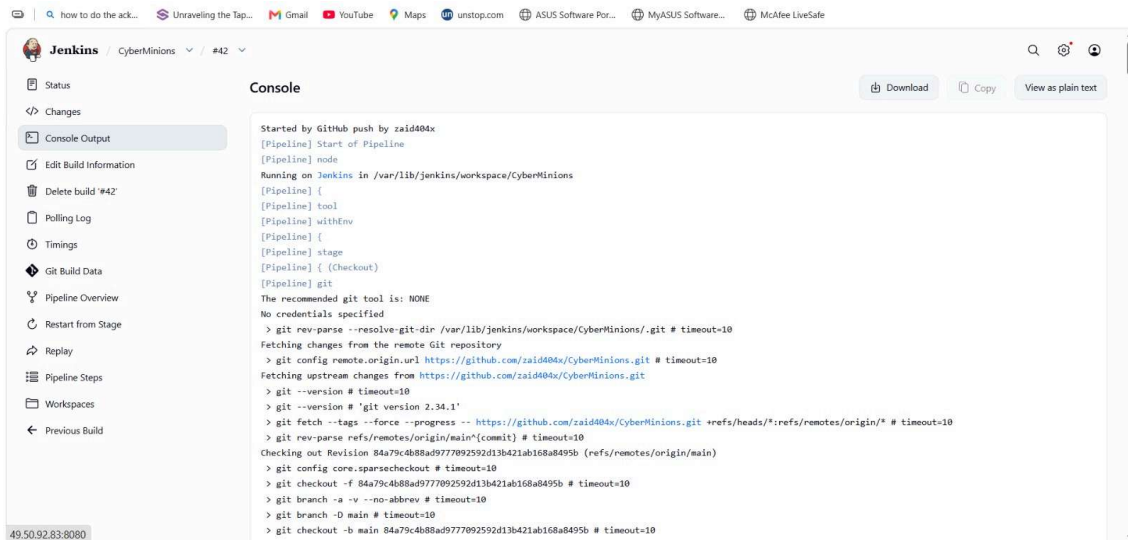

Stage 8: Verification

Deployment status is verified using:

`kubectl get pods`

`kubectl get svc`

9. SonarQube Integration

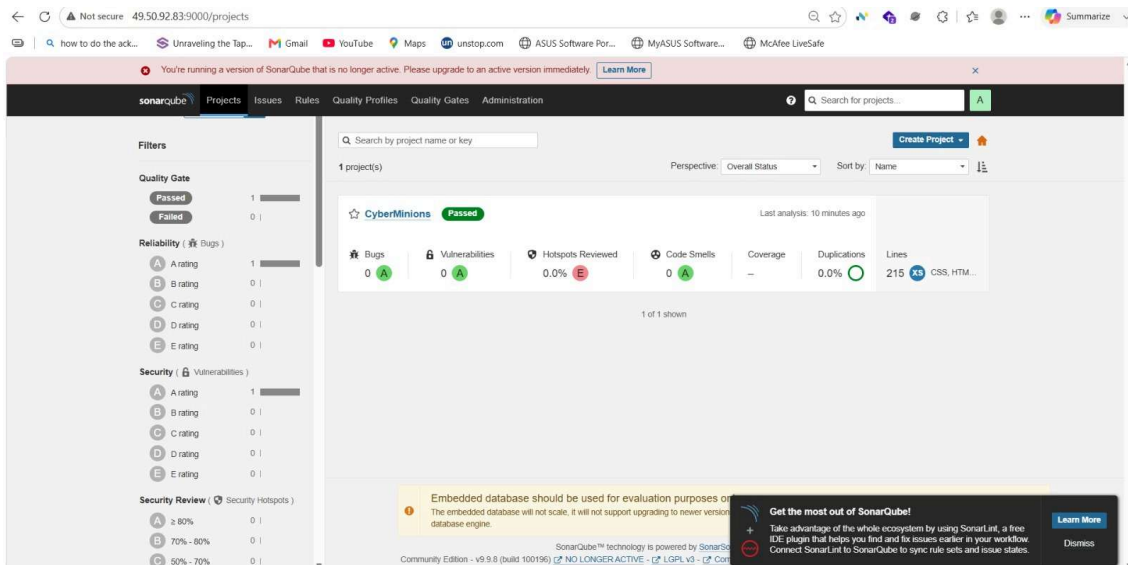

SonarQube was integrated with Jenkins to perform automated code quality analysis.

Configuration Steps

SonarQube deployment. => Authentication token generation. => Jenkins plugin installation.

=> Jenkins credential configuration. => Pipeline integration.

Outcome: Every build automatically performs source code inspection before deployment.

10. Trivy Security Scanning

Trivy was integrated into the CI/CD pipeline to implement DevSecOps security practices.

Filesystem Scan: `trivy fs` .

Container Image Scan: `trivy image cyberminions:v1`

Benefits: Early vulnerability detection, Container security validation, Security compliance improvement.

For OSS Maintainers: VEX Notice

If you're an OSS maintainer and Trivy has detected vulnerabilities in your project that you believe are not actually exploitable, consider issuing a VEX (Vulnerability Exploitability eXchange) statement.
VEX allows you to communicate the actual status of vulnerabilities in your project, improving security transparency and reducing false positives for your users.
Learn more and start using VEX: <https://trivy.dev/docs/v0.71/guide/supply-chain/vex/republishing-vex-documents>

To disable this notice, set the TRIVY_DISABLE_VEX_NOTICE environment variable.

Report Summary

12. Docker Hub Integration

Docker Hub was used as the container registry.

Workflow

Docker Build
↓
Docker Push
↓
Docker Hub
↓
Kubernetes Pull

Benefits: Centralized image storage, Easy image distribution, Version management.

13. Kubernetes Deployment

Application deployment was managed using Kubernetes manifests.

Deployment Resource

Responsibilities: Pod creation, Replica management, Rolling updates.

Service Resource

Responsibilities: Application exposure, Traffic routing, Verification Commands, `kubectl get deployments`, `kubectl get pods`, `kubectl get svc`.

14. GitHub Webhook Automation

GitHub Webhooks were configured to automate pipeline execution.

Workflow

Code Push

GitHub Webhook

Jenkins Build Trigger

Benefits: Fully automated CI/CD, Faster deployments, Reduced manual effort.

15. Monitoring Implementation

To achieve operational visibility, Prometheus and Grafana were deployed.

Prometheus: Prometheus was configured to collect metrics from:

Jenkins Server

Metrics monitored: CPU Usage, Memory Usage, Disk Utilization, System Load.

Kubernetes Cluster

Metrics monitored: Node Status, Pod Status, CPU Consumption, Memory Consumption, Cluster Health

Benefits: Real-time monitoring, Metric collection, Alerting capability.

Grafana: Grafana was connected to Prometheus as the data source.
Dashboards Created

Jenkins Monitoring Dashboard

Displays:

- CPU utilization
- Memory utilization
- Disk usage
- System performance

Kubernetes Monitoring Dashboard

Displays:

- Node health
- Pod metrics
- CPU consumption
- Memory consumption
- Cluster status

Benefits: Centralized monitoring, Interactive visualization, Operational insights.

16. Results

The project successfully implemented:

- ✓ Automated CI/CD Pipeline
- ✓ Source Code Management
- ✓ Static Code Analysis
- ✓ Vulnerability Scanning
- ✓ Docker Containerization
- ✓ Docker Hub Integration
- ✓ Kubernetes Deployment
- ✓ Automated GitHub Webhook Triggering
- ✓ Infrastructure Monitoring
- ✓ Grafana Visualization Dashboards

17. Challenges Faced

- SonarQube Integration
- Plugin configuration issues.
- Authentication token configuration.
- Docker Hub Authentication
- Registry authentication failures.
- Credential management.
- Kubernetes Access
- kubeconfig configuration issues.
- Jenkins-to-Kubernetes authentication.
- Webhook Configuration
- Endpoint accessibility validation.
- Trigger verification

18. Future Enhancements

- OWASP Dependency Check Integration
- Slack Notifications
- Email Alerts
- ArgoCD GitOps Deployment
- Kubernetes Ingress Controller
- High Availability Kubernetes Cluster
- Centralized Logging using ELK Stack
- Runtime Security using Falco

19. Conclusion

This project successfully demonstrates the implementation of a complete DevSecOps pipeline using modern cloud-native technologies. The solution automates software delivery while integrating security and monitoring practices throughout the deployment lifecycle.

The integration of GitHub, Jenkins, SonarQube, Trivy, Docker, Docker Hub, Kubernetes, Prometheus, and Grafana provides a production-oriented workflow that follows industry-standard DevSecOps principles and improves deployment efficiency, security, scalability, and observability.
